

Optical Microscopy Results

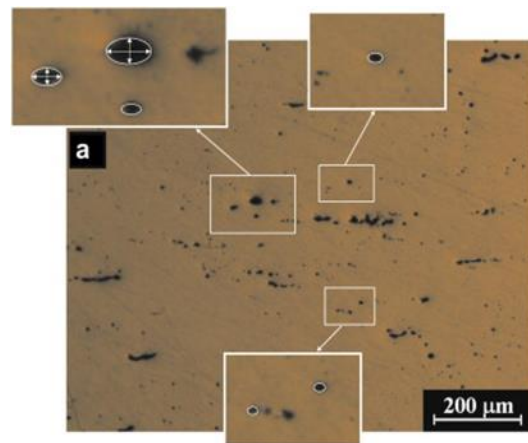

St. Christopher Alm Dish

The SciArt Project
2024

Results Report

Point of Interest 1: Main body of the dish, from the edge

With the optical microscope, some formations are spotted, that look like small holes, which are all in groups and they all have the same direction. This informs us that the metallic dish was pressed and struck for its final configuration.

Point of Interest 2: Relief

During the observation of the relief in the center of the dish we find a spot where we observe traces of gold color.
