Results Report

Point of Interest 1: Main body of the lamp

The observation of the lamp's surface with an optical microscope indicates that it is heterogeneous, as it consists of grains of various colors and sizes.

Point of Interest 2: Residues on the spout of the lamp

During the examination of the sample we collected from the lamp's spout, we see that it is composed of dark-coloured and rounded grains of different sizes. The morphology resembles that of a liquid.
