

Optical Microscopy Results

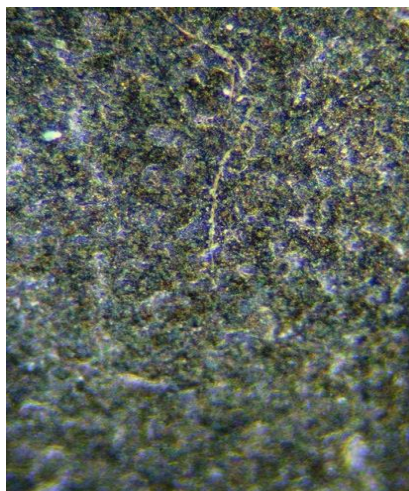

Roman Coin (Denarius)

The SciArt Project
2024

Results Report

Point of Interest 1: Main body of the coin, collected from the edge

The observation of the coin's surface with the optical microscope shows that it is quite worn, and we cannot identify any morphological features related to its manufacturing technology.

Point of Interest 2: Relief

By observing the relief on the coin, we identify a spot where we can see traces of red colour and we collect a sample for further study.
